

Appendix C

Exclusion data

Trial 2

For samples 12, 19, and 25 only grey stripes (missing value) or no stripes were visible at all in the actogram. Complete samples were removed from further analysis.

For samples 1, 8, 31, and 32 onset, CoG and offset were all on the same spot in the actogram. Complete samples were removed from further analysis.

For individual 10 and 17, cycle 1 was removed because phase markers were on the same spot in the actogram.

For sample 14, both values were the same and therefore complete sample was removed from further analysis.

For sample 21, cycle 2 was removed since no activity was visible for cycle 2.
